

# Derived Products Feature

## What it is

**Derived Products** adds the ability to create a new product with overrides for specific values, while keeping most of the configuration from a base product.

Variable and Modifier values are overridable, as well as properties like the Pricing Form or Income Account.

Customers can also create **Derived Products** directly from Line Items.

## Why use it

Customers often have related products. Keeping these product in sync was a manual task, until now.

**Derived Products** allow separate products based on other products with minimal configuration.

## Who will want it

- Customers who have lots of related products
- Customers who want faster setup of products
- Customers who want to create products off of line items

## Feature List

**Variable** overrides are available for **Derived Products**.
